1 Introduction	1
2 Development and phenology	7
2.1 Crop development: concepts and tools	8
2.1.1 Growth stages and phasic development	9
2.1.2 Events at the stem apex: the leek as a simple model species	11
2.1.3 Events at stem apices: branching and reproductive development in wheat	13
2.1.4 Events at stem apices: the consequences of separation of male and female organs in maize	15
2.1.5 Phenology determined by events at axillary meristems: determinate and indeterminate soybean varieties	18
2.1.6 Components of yield	21
2.2 Case histories: the influence of environment and management on crop development and phenology	22
2.2.1 Convergence and synchrony: the influence of sowing date on winter wheat in Northern Europe	22
2.2.2 Crop improvement and the anthesis–silking interval in maize	25
2.2.3 Adaptation of soybean to different latitudes: phasic analysis of the photoperiodic control of flowering	26
2.2.4 Development in storage: physiological age and tuber initiation in the potato	30
2.2.5 Complementary phenologies and plant habits in mixed cropping: temperate grass/clover swards	32
3 Interception of solar radiation by the canopy	35
3.1 The life history of a leaf	35
3.2 The components of plant leaf area expansion	40
3.2.1 Crop emergence	40
3.2.2 Leaf production	41
3.2.3 Leaf expansion	43
3.2.4 Branching	47
3.2.5 Senescence, removal and damage – leaf lifespan	50

3.3	The development of the crop canopy: leaf area index	53
3.3.1	Seasonal development of leaf area index	53
3.3.2	Leaf area index and crop management	55
3.4	Canopy architecture and the interception of solar radiation	60
3.4.1	Seasonal patterns of interception	60
3.4.2	Optimum and critical leaf area indices	61
3.4.3	Leaf photosynthesis and canopy properties	63
3.4.4	Canopy extinction coefficient	66
4	Photosynthesis and photorespiration	73
4.1	Introduction	73
4.2	Photosynthetic efficiency	75
4.3	Photosynthetic processes	80
4.3.1	Photosynthesis as a cellular biochemical process	80
4.3.2	Photosynthesis as a leaf diffusive process	89
4.3.3	Photosynthesis as a crop canopy process	95
4.4	The C ₄ photosynthesis mechanism	99
4.5	Water shortage and photosynthesis	104
4.6	Nitrogen effects on photosynthesis	109
4.7	Ozone effects on photosynthesis and crop productivity	112
5	The loss of CO₂: respiration	117
5.1	Introduction	117
5.2	The basis of crop respiration	120
5.3	Growth and maintenance respiration	123
5.4	The respiration of different plant substrates	126
5.5	Growth and maintenance respiration in the field	130
5.6	Respiration associated with crop processes	134
5.7	Environmental effects on respiration	140
5.8	Crop respiration in the future	142
6	The partitioning of dry matter to harvested organs	145
6.1	The processes and pathways of assimilate partitioning	145
6.2	Ontogeny and assimilate partitioning: a survey of source/sink relationships	148
6.3	Time courses of dry matter partitioning: harvest index	151
6.4	Limitation of yield by source or sink	153
6.5	Sink limitation of yield in cereals – physiology of ineffective grain setting	157
6.6	Assimilate partitioning and crop improvement: historic trends in harvest index of wheat and barley	162
6.7	Assimilate partitioning and crop improvement: historic trends in harvest index of maize	165
6.8	Assimilate partitioning to potato tubers	167
6.9	Assimilate partitioning in grassland: implications for management of grass yield	171

6.10	Assimilate partitioning in grassland: implications for the overwintering and early growth of white clover	176
6.11	Assimilate partitioning in diseased plants: temperate cereals affected by biotrophic fungal pathogens	178
7	Limiting factors and the achievement of high yield	180
7.1	Limitation by water supply	181
7.1.1	Acquisition of water	182
7.1.2	Water use efficiency	186
7.1.3	Crop yield where water supply is limiting	190
7.2	Limitation by nitrogen supply	193
7.2.1	Acquisition of nitrogen	193
7.2.2	Nitrogen use efficiency	196
7.2.3	Crop yield where N supply is limiting	200
7.3	Achieving high yield: resource capture and assimilate partitioning	202
8	Physiology of crop quality	205
8.1	Wheat: protein content	206
8.2	Soybean: oil and protein contents	209
8.3	Oilseed rape: glucosinolates and erucic acid	212
8.4	Potato: tuber size and processing quality	215
8.5	The quality of conserved forages: ontogeny and yield	217
9	The simulation modelling of crops	222
9.1	Introduction	222
9.2	Building a crop model	225
9.3	Crop models of wheat (AFRC2), soybean (CROPGRO) and maize	227
9.3.1	The AFRC2 wheat model	228
9.3.2	The CROPGRO soybean model	243
9.3.3	The maize model	253
9.4	Modelling variety differences and traits	257
9.5	Conclusions	261
10	Crop physiology: the future	264
10.1	Introduction	264
10.2	Lowering inputs	265
10.3	Climate change	267
10.4	Quality	269
10.5	New crops	270
10.6	The potential for increasing crop photosynthesis and yield	272
10.7	The last words	275
